TesPro Gateway Product
Certification Scope Allocation Statement

(Short form – for written confirmation by the customer)

Version: v1.0 Date: 2026-10-21 Issued by: TesPro

1. Conclusions

1.1 The object of TesPro's certification is its own gateway platform product. The certificate covers the safety and EMC conformity of that product within the configuration baseline stated on the certificate (hardware revision, firmware version, and the specified power supply, enclosure and interface configuration).

1.2 The finished product built on that platform - sold under the HiTEKS model number or under the customer's own brand - is certified by the final-product integrator in its own name and under its own model number. The certificate and test reports issued by TesPro are inputs to that final certification; they are not equivalent to the final product certificate.

1.3 The platform certificate extends to the platform baseline only. Any change made by the customer to the enclosure, power supply, wiring, nameplate or functional ports is assessed through the change-control process of the final-product holder, which issues a written conclusion. Changes that affect the platform baseline additionally require a technical assessment by TesPro and, where necessary, retesting.

2. Scope allocation

Item	Platform (certified by TesPro)	Finished product (certified by the final-product holder)	Customer customisation
Certifying party	TesPro	Final-product integrator (HiTEKS or the customer-appointed manufacturer)	The customer is the party responsible for the customisation, subject to review by the final-product holder
Scope of certification	Platform baseline: structural and electrical safety (insulation, creepage, withstand), temperature rise and enclosure flammability, accessibility, EMC immunity and emission, environmental performance	Final enclosure material and flammability, the power supply actually used, port and wiring definitions, EMC port classification, degree of protection, nameplate and instructions for use, final product configuration file	The customisation itself and the technical assessment conclusion on its impact on the certificates
Not covered	Any finished product in which the customer has changed the enclosure, power supply, added or removed ports, or applied its own brand	Field modifications made by the customer	Any change affecting insulation and creepage distances, flammability, temperature rise, EMC performance or conformity with the applicable standards
Change procedure	Technical assessment issued by TesPro, with retesting where necessary	Change assessment, supplementary testing or re-certification	Raised by the customer, with associated cost and responsibility borne by the customer

3. Standards path (determined by function, not by the enclosure)

Product function	Applicable standards	Remarks
Communication / data-forwarding gateway only (no measuring inputs, SELV supply, Ethernet / cellular / digital I/O)	IEC/EN 62368-1 (safety); EN 61326-1 Class A or EN 61000-6-x (EMC)	Neither the IEC 61557 series nor the IEC 61010 series applies

Includes voltage, current, temperature or CT measuring inputs, or digital outputs driving loads directly	IEC 61010-1 as the primary path; IEC 61010-2-030 where live measuring circuits are involved	The IEC 61557 series does not apply
Test and measuring equipment for low-voltage distribution systems (insulation, loop impedance, earth continuity, earthing impedance, etc.)	IEC 61557-1 and the relevant specific Parts, in addition to IEC 61010-1	Enclosure provisions per IEC 61010-1 Clause 6 / Annex K and the corresponding Parts
Sold as a stand-alone metering device for energy settlement in CCI / charging applications	IEC 62053-21 and IEC 62053-12 (MID conformity assessment also involved)	IEC 61010-1 generally does not apply
Charging communication controller (CCI side)	IEC 61851-1 / IEC 61851-21	Independent of the measurement path

Note: the standard references above are ultimately governed by the standards list stated on TesPro's CB certificate / test report. If the reference in question is to IEC 62053-12 (energy meters, MID related), that belongs to a certification path entirely different from the IEC 61557 series. If IEC 61557-12 is indeed intended, TesPro will provide its official title, year of publication and its correspondence to the standards list on the certificate.

4. Status of this document

This document defines the boundary between the responsibilities of TesPro's certification and those of the final-product certification only. It does not constitute a new certification commitment. The validity of a certificate is governed by the certificate documents issued by TesPro and by the final-product holder, and the specific models and configurations covered are those listed in those documents.
